About Hammer

Our History

Skills and passion that give rise to history!

In 1970, Mr. Giovanni Modugno began his career as a worker in a small mechanic turnery workshop in Molfetta and, since that year, so much has been done.

After being a factory worker first, production and factory manager then, in 1989 he started, with other partners, a hydraulic breakers company, until 2004. In the same year, he decides to found, together with his son Valerio, a family company for design, production and sale of hydraulic breakers, which takes the name "Hammer".

The values of a family company have allowed Hammer to establish itself on the global market through 10 branches spread across the continents and a capillary network of dealers and authorized workshops throughout the world.

444

Research and development

Our work is based on research and continuous innovation. In our 10 factories in Molfetta there are:

- an equipped workshop with 70 high-productivity CNC machines;

- the grinding and testing department, where we make sure that the various components of our products are flawless:

- the carpentry department, equipped with 10 latest generation plasma cuttings, 5 robot welding stations and 2 robot stations for assembly;

-the assembly department, in which our qualified and constantly trained staff assembles the whole Hammer line:

- a large spare parts warehouse that, thanks to the 12 vertical automated modules, allows us to speed up and optimize the assembly of our range and to increase the storage area of 8000 m2.

We always look for new solutions and innovations on existing products to offer our customers always the best in the market.

100% Made in Italy

Hammer guarantees a 100% Made in Italy product of the highest quality, entirely designed and manufactured in the 10 plants (an area of 60000 m²) located in the Industrial Area of Molfetta (BA). Hammer begins with the design, production and sale of small and medium-sized hydraulic breakers, in addition to the sale of multi-brand spare parts.

Then comes the introduction of the first samples of demolition shears, which paved the way in the field of demolition and recycling; later, Hammer decides to expand the range of hydraulic breakers, up to the FX 15000 model which, with a weight of 14500 kg, becomes the largest hydraulic breaker in the world.

After the huge success achieved in this segment, Hammer introduces the SB series that benefits from the particular monoblock construction. This feature gives the structure a very high resistance to leverage efforts. The breakes, as "monobloc" suggests, has only one piece and there are no side bolts and diaphragms.

It is the turn, then, of the grapple line, with the GR series with 3 different types of jaws, depending on the needs.

The demolition segment is then widened with the FP series (static hydraulic crusher for secondary demolition), the FR series (rotary hydraulic crusher for primary and secondary demolition) and finally the brand new FRK and FPK series.

NOTE

Strength and efficiency

The hydraulic breaker is mainly used in earth-moving and mining industries, where components are subjected to high levels of stress, working mostly in difficult situations.

To make hydraulic breakers increasingly reliable and to guarantee both performance and power, Hammer has introduced the SB and FX lines, obtained thanks to in-depth R&D carried out throughout the years.

For the production of this equipment, top-quality alloy steels are used and the best heat treatment techniques developed.

The research and studies carried out have allowed us to obtain important results in terms of the technological and mechanical characteristics of the steels.

At the same time, studies were carried out in collaboration with the main producers of hydraulic seals (Trelleborg, Freudenberg, Nok).

Over the years we have therefore improved both quality and type of the materials used to reach the appropriate ratio between different speeds, pressures and temperatures, thus increasing durability.

Breakers of both SB and FX series are "nitrogen" breakers. Hammer, thanks to its experience, followed this path in order to obtain high power distributed over a higher number of blows per minute, thus resisting high counterpressures (up to 30 bar).

The breaker is also very compactly structured hence reducing stress on the excavator's arm and ensure greater durability of both the breaker and its components.

• The SB and FX hydraulic breakers can work on any type of excavator and on any single-acting hydraulic system; they are also suitable for hydraulic systems with high back pressure

• Hammer Breakers are equipped with special polyurethane shock absorbers that absorb vibrations, thus protecting the arm of the excavator and also reducing noise emissions, according to the requirements of directive 2000/14 / EC

While the SB series is suitable for carriers, mini excavators, miniblades, backhoe loaders, demolition robots. etc., the FX series is suitable for crawler and wheeled excavators of medium and large size.

BREAK IN A SMART WAY

Monobloc hydraulic breaker without tie rods and diaphragm

More power, less vibration and maintenance. The SB breakers work with inertial nitrogen energy recovery, thus obtaining more power (more than 30%) and less vibration thanks to the nitrogen chamber that reduces maintenance costs, since it has no diaphragm.

2 Long lasting nitrogen charge.

In the past, energy recovery breakers required frequent nitrogen refills; with the new sealing system and the new compound developed by Freudenberg they are able to guarantee a gas tightness equal to 300% more than in the past.

3 Protected tubes.

The tubes are completely protected through the casing and they're suitable for every type of excavation, especially in narrow spaces.

4 The particular design, with a closed box casing as well as the addition of sound-absorbing material, allowed the breaker to have very low noise levels

5 Double retainer pin.

6

The tool-locking system with a double retainer pin allows adequate and uniform wear of the same and ensures longer maintenance intervals for the whole locking system.

Monobloc body without tie rods. The entire SB series benefits from the particular monoblock construction; this feature gives the structure a very high resistance to leverage, during work. The breaker is built in one only piece and it is without tie rods, thus obtaining greater production and less maintenance as a result.

Only two moving parts.

- 8 For all types of installations (pressurization). The SB series tolerates high back pressure, and it has a wide calibration range of the required oil flow, in order to make the installation easier.
- 9 The piston moves in a single interchangeable cylinder liner that keeps the main body intact and that is easy to replace in case of necessity.
- **10** The piston is built with a special geometry as to keep a constant energy of impact, and to reduce damage in any critical condition.
- 11 Visibility and versatility. The models of the SB series, with their tapered shape, provide the operator with an excellent view during the work and allow to operate close to the walls, both in narrow and wide spaces.
- 12 Hydraulic system for blank firings. The hydraulic system creates a regenerative oil circuit that preserves the breaker from blank firings when the tool is not in contact with the rock.

EFFICIENCY BECOMES POWER

Hammer Hydraulic Breakers

1	Tubes with swivels. Tubes with swivels are fully protected from any misuse and, resistant to vibrations.
2	Operating pressure regulation. For the FX series (FX950-15000), it is possible to adjust the working pressure with a manual valve located frontally on the distribution box.
3	Anti-dust and underwater work setup You can prevent the entry of dust and water into the breaker by blowing air into the proper hole in the front part of the breaker, with a pressure of not less less than 10 bar.
4	Automatic hydraulic greasing device (optional, mounted on the breaker). The Beka-Lube automatic lubrication system optimizes the lubrication procedure and reduces maintenance and downtimes
5	Automatic hydraulic greasing device with exclusive Hammer electric control (optional, mounted on the excavator). Innovative electric system with automatic grease distribution, less liable to vibration breakages thanks to its tank of grease with a capacity of 4 kg or 8 kg, making thus the system cheaper than all the other devices with single cartridges.
6	Manual blows adjustment. For the FX series (FX950-FX15000), the regulation of the blows is carried out manually by a valve located on the side of the breaker.
7	Hydraulic system for blank firings. The hydraulic system creates a regenerative oil circuit that preserves the breaker from blank firings when the tool is not in contact with the rock.
8	The piston is built with a special geometry as to keep a constant energy of impact, and to reduce damage in any critical condition.
9	Anti-dust system for tunnels (optional). The anti-dust system consists of a dustproof seal addition mounted in the lower bush to avoid the entry of impurities into the circuit. FX series breakers are suitable for secondary demolition work excavations in quarry, work in urban areas, tunnels, pipelines, and railway tunnels and, concerning the biggest models, demolitions in open pit mining.

Hammer Lube

HAMMER LUBE is the result of intense cooperation between the Engineering Departments of Hammer and Meyerlub, both specialists in advanced technology. Hammer Grease is totally different from any other breaker's grease or oil.

• It is based on special synthetic components, with a strong affinity to metal surfaces due to their "polar" nature. This offers superior lubricating film strength, even in the most adverse operating conditions.

 Its physical characteristics perfectly match the Hammer lubricant supply systems (on-board Greasing Stations and Easy-Lub equipment)

HAMMER GREASE KEEPS ITS PROMISES!

 Total protection from friction, wear and scuffing, thanks to the exceptional film strength and metal affinity

• Complete and uniform distribution of lubricant on the whole surface, for a complete protection from wear and seizing

• Cost saving: highly efficient lubrication ensures complete protection, reducing drastically maintenance, spares and downtime costs. The exclusive and "state of the art" performance of Hammer Grease optimizes lubrication efficiency and signicantly reduces lubricant's overconsumption and relevant costs.

CONSIDER THE DIFFERENCE

Hammer breakers, rolling bearings and machinery pins have very different engineering features; therefore lubrication requirements change accordingly. Hammer lube is a tailormade product, thought intentionally for hydraulic breakers.

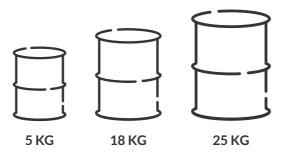

WHY IS CORRECT LUBRICATION SO IMPORTANT?

Hammer breakers operate at high frequencies under heavy loads, involving high thermal and mechanical stress. Inadequate lubricants generate excessive wear and deposits.

BREAKER LIFE SPAN, EFFICIENCY, AND RELIABILITY MAY BE SERIOUSLY AFFECTED.

Proper breaker lubrication is the combination of:

- Appropriate lubricating system design.
- Appropriate lubricant structure and composition.
- Perfect tuning between lubricant and application system.

SCREENING BUCKET for excavators from 1.4 to 65 ton

Recycle and save!

Recommended for:

- Selection of pebbles along watercourses.
- Filling of containment cages.
- Selection of waste materials after demolition.
- Reclamation of stony soils.
- Removal of stones along the beaches.
- Separation of organic waste in landfill.
- Aggregate recovery in building renovations.
- Maintenance of public and private green areas.
- Coverage of pipes in canalization works.

BVR SERIES

- Inlet profile inclined to facilitate loading of the material to be screened.
- Also available in wheel-loader version.
- Perimeter kit available in braided net or perforated sheet.
- Perimeter kit consisting of 4 bent sections bolted to the basket easily replaceable by the operator.
- From BVR12E on, the tapered bottom increases the screening surface.
- Integrated high-pressure relief valve that protects the motor against pressure peaks.
- Hydraulic components protected by the frame and easy to access for possible inspections.
- Double-turn ball bearing to fully support the screening basket.

Extremely versatile and compact equipment, designed for selection and screening operations.

SCREENING BUCKET

for excavators from 3 to 14 ton

Recycle and save!

- Safety valve It protects the engine against the pressure peaks occurring during the working cycles.
- Shaft system All knives are made of HB400. Different shaft configurations realized upon request
- Patented shaft replacement system Thanks to the patented system, it is possible to replace shafts rapidly and modify the sieved material size, without intervening on transmission.

OPTIONAL

~~

- DC Teeth and DTE Teeth.
- Flow reversal valve kit.

It makes the hydraulic flow bi-directional allowing to use the screening buckets with mono-directional system machines.

Flowrate reducers. Advised for machines with oilflow higher than 70 l/min.

MULTISCREENING BUCKET

for excavators from 5 to 35 ton

Recycle and save!

HB400 Drums

The drums can afford high work rates thanks to their highly

resistant material that extends their service life.

Automatic screening system The new rotary double drum concept with hydraulic control from the cab allows to select the material size, from 25 to 60 mm (1 - 2.4 in) and up to 65 mm (2.5 in) for the VMS20-VMS30,

• Without stopping the work cycle.

VMS SERIES

TECHNICAL DRAWING

OPTIONAL

- DC Teeth and DTE Teeth
- 6-Way solenoid valve kit It allows both the rotating and the hydraulic sliding
- movements of the sieves on machines with single and double-effect line.

Control kit with magnets to easily put it inside the cab.
