## **1** INTRODUCTION

## 1.1 Dear customer

Congratulations on your new purchase of a high quality measurement device, the IGTM Gas Turbine Meter. To take full advantage of the potential of your metering equipment, we advise you to thoroughly read this manual and follow the recommendations and warnings.

This manual gives recommendations to enable you to obtain highly accurate metering results and describes the handling, installation, and maintenance of your turbine meter. It is very important that you follow the safety recommendations for installation, hook up, and the maintenance guidelines.

This document contains the unit dimensions and operational ranges. It also describes performance, calibration, and outputs of the instrument.

## 1.2 Notice

**vemm tec** Messtechnik GmbH ("**vemm tec**") shall not be liable for technical or editorial errors in this manual or omissions from this manual. **vemm tec** makes no warranties, express or implied, including the implied warranties of merchantability, and fitness for a particular purpose with respect to this manual. In no event, shall **vemm tec** be liable for any special or consequential damages including, but not limited to, loss of production, loss of profits, etc.

Product names used herein are for manufacturer or supplier identification only and may be trademarks / registered trademarks of these companies.

## 1.3 Brief description

The *vemm tec* IGTM (International Gas Turbine Meter) is designed in accordance with all major international standards.

The IGTM counts the increment of gas volume flowing through an annular passage in the meter. The gas volume is totalized on a local mechanical counter. In addition, pulse signals are generated to infer the gas flow and volume. The indicated gas volume is the actual volume that passed the meter at the actual temperature and pressure.

The IGTM is available in two models; CT and WT. The CT-model is approved for custody transfer in the European Community and other countries. It provides a high-accuracy turbine meter with a mechanical counter and electronic pulse outputs. The IGTM-CT has a body length of three times the nominal diameter: 3 DN. The IGTM-WT (Wafer Type) is a short meter with an aluminium body, and needs to be clamped between flanges. The WT model is only available for low pressure classes (PN10/16 and ANSI 150#). The IGTM-WT model is not suitable for custody transfer purposes.

## 1.4 Parts and documents supplied with the IGTM

Your package includes:

- IGTM Gas Turbine Meter
- Bottle with lubricant for initial lubrication and two years operation (for meters with a lubrication system only)
- Male connectors (when ordered; the female sockets are mounted in the index head of the meter, the ordered male plugs are delivered unassembled for connection on site)
- Female connectors (when ordered; the male sockets are mounted in the HF1 and HF2 of the meter, the ordered female plugs are delivered unassembled for connection on site)
- Copies of calibration documents (if applicable)
- Copies of pressure test documents (if applicable)
- "Installation, Operation and Maintenance Manual" (this manual; as a hard copy or as PDF file)

The complete original certificates ordered will be shipped separately. If applicable (and if ordered) the documents supplied are:

- Inspection Certificate EN 10204 3.1
- Pressure test certificates (hydro test and air seal test)
- Verification certificate (of legal calibration) or Certificate of Conformity
- Calibration results (data and error curve)
- High pressure calibration certificate
- Applicable CE documentation (ATEX, PED, for IGTM-CT also MID)
- Material certificates of pressure containing parts
- Welding certificates
- Non-destructive test: Radiographic Examination Record
- Others on request

Each shipment is checked for completeness and released by Quality Assurance Staff prior to shipment.

You should check the meter and accessories by means of the order acknowledgement and the delivery note for completeness. Any damages caused during transport should also be checked. Please immediately contact your sales agent, if the goods are incomplete or damaged.

## 1.5 Instructions for storage and conservation

- A gas turbine meter is a high precision instrument; it should be handled with care.
- Never use the index head or the oil pump to lift the meter.

*vemm tec* suggests storing the IGTM in the original crating/packing to avoid damage during storage. IGTM gas turbine meters must be stored in a non-condensing atmosphere in a temperature range from -25 to +55 °C. If a meter is stored for more than 3 months or under alternative conditions, the meter needs to be conserved properly.

**verim tec** suggests to keep the original crating/packing of your IGTM gas turbine meter for future use. Please use the original crating/packing and fixing materials to secure your IGTM during all further transports, and to avoid damage during transport.

## **1.6 Principle of operation**

The operation of the IGTM is based on the measurement of the velocity of gas. The flowing gas is accelerated and conditioned by the meter's straightening section. The integrated straightening vanes prepare the gas flow profile by removing undesirable swirl, turbulence and asymmetry before the gas reaches the rotating turbine wheel. The dynamic forces of the flowing fluid cause the rotor to rotate. The turbine wheel is mounted on the main shaft with special high-precision and low-friction ball bearings. The turbine wheel has helical blades with a known angle relative to the gas flow. The conditioned and accelerated gas drives the turbine wheel with an angular velocity that is proportional with the gas velocity. The rotation of the turbine wheel and the main shaft eventually drive the eight digit mechanical counter in the index head. The rotating turbine wheel can also generate pulses directly by proximity sensors that create a pulse for each passing turbine blade. By accumulating the pulses, the total passed volume and gas flow rate can be calculated.

## 1.7 Nameplate details

Your meter is equipped with a main label. Figure 2 shows the English version. Alternatively, labels are available in German or other languages. The label contains information such as size, pressure rating, and flow rate which are valid for this meter. Please refer to Table 14 to check size and G rating. Only use the meter in the indicated ranges for flow, pressure and temperature.

Figure 2: Name plate (MID version), CE/PED label and pulse label

## **1.8 Documentation**

## 1.8.1 Approvals

The IGTM was specifically designed to be in accordance with all relevant international standards, including EC (European Community) directives MID and PED and the rigid German regulations for custody transfer. Please refer to Table 9 for a list of technical standards, rules, and guidelines.

The IGTM-CT meter is approved for custody transfer in all EC countries. Please refer to Figure 17 for the original style EC type approval certificate; and to Figure 18 for the MID approval. Metrological type approvals are also available for Algeria, Brazil, China, Hungary, Malaysia and South Korea. Other approvals are pending. Please contact **vemm tec** for a complete list.

If your meter was ordered to be in accordance with a specific (country) approval the main label should be in accordance with that approval. If no specific approval was specified at the time of order, the standard label in English language will be applied.

## 1.8.2 Inspection certificate EN 10204 - 3.1

Every meter can be delivered with an "Inspection Certificate EN 10204 - 3.1" (see Figure 3).

As an option, you may order the complete Material Certification Package 3.1 containing:

- "Hydro Test Protocol" and "Air Seal Test Protocol"
- Material certificates of pressure containing parts
- ATEX / EEx (intrinsically safe) certification of the high frequency (NAMUR) sensors
- Welding certificates (if applicable)
- Non-destructive test reports (X-ray) (if applicable)

Additional certification please order separately, for example: other non-destructive test reports or third party inspection certificates.

## 1.8.3 Hydro test and air seal test

All IGTMs are statically pressure tested in accordance with the flange rating and with the appropriate standards and customer requirements. Flange ratings and maximum operating pressures of the IGTM are mentioned in Section 3.4 and on the CE label.

- Hydro test of the meter housing at 1.5 x maximum operating pressure
- Air seal test of the completely assembled meter at 1.1 x maximum operating pressure

Certificates of these tests are included in the optional Material Certification Package 3.1. (This must be requested at the time of your order.) Each meter is marked with **Wx Lx** on the meter flange (for the IGTM-WT at the meter body), where x is a single digit number, to indicate that the test is passed.

## 1.8.4 Initial verification and calibration

Gas flow meters for custody transfer purposes usually have an initial verification (legal calibration) or under MID rules a calibration and final verification according to Module F or Module D.

The reference meters used for the calibrations are traceable to the national standards of the Federal Republic of Germany at the Physikalisch-Technische Bundesanstalt (PTB). The calibration managers are certified verification officers. After having passed the calibration, a "Verification certificate" is issued. It is signed and stamped (or equivalent according to the applicable approvals).

If a legal verification certificate is not required, a factory calibration with air at ambient conditions is performed at above mentioned calibration facility. The "Certificate of Conformity" proves that the meter has been tested and complies with the stated error limits. It is signed and stamped by "*vemm tec* Messtechnik GmbH".

In both cases (verification or factory calibration) a two page certificate with the measured data and curve can be issued at additional cost.

The k-factors [Imp/m<sup>3</sup>] for the HF sensors of each IGTM are determined during calibration. They are shown on a label on the index head and the calibration certificate with 6 significant digits. The k-factors are specific for each meter and correspond with specific gears in the index head. The factor determined by the calibration is the one that should be used in your calculations and flow correcting devices.

Each IGTM has been flow tested, quality checked, and sealed.

If at any time the meter is re-calibrated and the correction gears in the index head are changed, the k-factor for the HF sensors must also be adjusted.

Please verify that all seals are present before mounting the meter in the pipeline (refer to Figure 22 for seal locations). If any of the seals are broken, removed or damaged, the meter may not be used for custody transfer measurements in most countries. The seals must not be painted. Your warranty will become void, if any lead seal with the original stamp is damaged.

If requested, high pressure calibrations with natural gas will be performed at external High Pressure Test Facilities, such as PIGSAR Dorsten (Germany), EnBW PasCaLab Stuttgart (Germany), NMi Euroloop (The Netherlands), or FORCE (Denmark). These facilities are approved for legal verifications in the respective countries. Please enquire.

The Laboratoire national de métrologie et d'essais (LNE) is the company designated by the French government as responsible of policy in terms of metrology in replacement of BNM (Bureau National de Métrologie) since January 2005.

The LNE is also designated by the French government as the Legal Metrology Service to perform type approvats and verifications. Thus, it is the fundamental bask of the LNE to realize, develop and maintain the national primary standards and to insure the traceability of industries and users to the S.I units by the realization of specific instrumentation and calibration benches.

## **2** INSTALLATION

## 2.1 Safety instructions and warnings: See back page

## 2.2 Instructions specific to the EC Pressure Equipment Directive (PED)

This chapter identifies specific installation and operation instructions necessary to ensure compliance with the Essential Safety Requirements (ESR) of the European Economic Area Pressure Equipment Directive (PED) 2014/68/EU.

This document applies to IGTM Gas Turbine Meters manufactured by *vemm tec* Messtechnik GmbH (Potsdam-Babelsberg, Germany).

*vemm tec* Messtechnik GmbH's IGTM Gas Turbine Meters are supplied as components to be installed in the end users piping system. It is therefore the responsibility of the end user to ensure compliance with the requirements of the directive and regulations quoted in this section. Guidance for compliance of the relevant Essential Safety Requirements of the Pressure Equipment Directive 2014/68/EU is given below.

You will find an example PED Declaration in Figure 18.

PED ESR Ref.	Essential Safety Requirements (ESR)	Compliance Requirement
2.3	Provisions to ensure safe handling and operation.	
	The method of operation specified for pressure equipment must be such as to preclude any reasonably foreseen risk in operation of the equipment. Particular attention must be paid, where appropriate to the following.	
	Closures & openings	During removal and replacement of any parts such as the index head, the lubrication system, high frequency sensors or thermo- wells, the end user shall ensure that the meter has been properly isolated and the internal pressure has been safely vented.
	Devices to prevent physical access whilst pressure or a vacuum exists	The end user shall ensure that the IGTMs are installed in a properly designed system with access limitation in place if required.
	Surface temperature	It is the responsibility of the end user to assess the expected surface temperature in service, and if necessary, take precautions to avoid personnel coming into contact with the equipment.
	Decomposition of unstable fluids	It is not envisaged that, for the designed service, the equipment shall come into contact with unstable fluids. However, the end user should assess the risk and take any steps considered necessary.

2.4	Means of examination	
	Pressure equipment must be designed and constructed so that all necessary examinations to ensure safety can be carried out.	For the examination of all pressure containing parts of the IGTM, the meter needs to be removed from the line. It is the responsibility of the end user to ensure that the internal pressure has been safely vented before the meter is removed from the line. It is also the responsibility of the end user to use suitable material and that the employees performing the removal are well trained in assembling and disassembling high pressure gas lines.
		The end user should refer to the "Installation, Operation and Maintenance Manual" supplied with each meter. It is not considered that the process medium for which the equipment is designed will give rise to severe corrosion/erosion problems. It is the end user's responsibility to monitor any change in the process medium that may cause concern.
2.5	Means of draining and venting	
	Harmful effects such as vacuum collapse, corrosion, and uncontrolled chemical reactions must be avoided.	It is the responsibility of the end user to ensure that the equipment is installed in a well-designed piping system to avoid such hazards.
2.6	Corrosion or other chemical attack	It is not probable that the process medium for which the equipment is designed will give rise to severe corrosion problems. It is the end user's responsibility to monitor any change in the process medium that may cause concern.
2.7	Wear	It is not considered that the use of the IGTM for fluid metering will give rise to any abnormal wear problems. It is the responsibility of the end user to install any necessary filtration upstream of the IGTM to maintain the condition of the process medium. In addition, ensure that no moisture or particles larger than 10 $\mu$ m can enter the meter.
2.10	Protection against exceeding the allowable limits of the pressure equipment	The IGTM must be installed in a well-designed piping system with adequate protection against excessive pressure.
2.12	External fire	The IGTM has no special accessories for fire damage limitation. It is the responsibility of the end user to provide adequate fire fighting facilities on site.
7.3	Pressure limiting devices, particularly for pressure vessels	The IGTM is not a pressure vessel and has no integral pressure limiting devices. It is the responsibility of the end user to ensure that the IGTM is installed in a well-designed system so that momentary pressure surges are limited to fewer than 10 % of the IGTM's maximum operating pressure.
	-	

## 2.3 Installation

Your IGTM is a high precision metering instrument that can only perform efficiently when the following installation guidelines are followed.

# NOTE: Install the meter preferably indoors. If installed outdoors, it is recommended to protect the meter from direct sunlight and rain.

## 2.3.1 Lubrication system and lubrication before start up

Each standard IGTM-CT is equipped with an oil system and lubrication pump. The oil pump is dimensioned according to the size of the meter, as mentioned in Table 2.

- The small oil pump is operated by a push button: Remove the hex-cap before operating.
- The larger pumps have an operating lever: One stroke is to move the lever forward and back to its original position.
- Consider at least additional 5 cm distance between the pump of the IGTM Turbine Gas meter and a barrier (e. g. a wall) according to "E" in table 17, enabling you to operate the pump.

As an option, your IGTM-CT up to and including DN 100 (4"); of pressure classed PN10/16 and ANSI 150 can be provided with permanently lubricated bearings. No oil pump is supplied with these kinds of meters.

The IGTM-WT is provided with permanent lubricated bearings for the sizes DN50 (2") to DN100 (4"). Bigger diameters are provides with a lubrication system.

#### CAUTION: Before the initial start-up meters with an oil pump must be lubricated as described in this section.

Table 2	: Oil	num	ุ่กร
TUDIC Z	. 011	pung	05

Meter size IGTM-CT	Meter size IGTM-WT	Oil pump size	Volume / Stroke	Container
Optional for CT DN 50 (2") / DN 80 (3") DN 100 (4")	DN 50 (2") / DN65 (2½") DN 80 (3") / DN 100 (4")		No lubrication pump; e time lubricated bear	
Standard for CT DN 50 (2") / DN 80 (3") DN 100 (4")	DN 150 (6") DN 200 (8")	Small	0.14 cm <sup>3</sup> /Stroke	1 cm <sup>3</sup>
DN 150 (6") / DN 200 (8") / DN 250 (10")		Medium	0.5 cm <sup>3</sup> /Stroke	10 cm <sup>3</sup>
DN 300 (12") / DN 400 (16") <sup>1)</sup>		Large	0.5 cm <sup>3</sup> /Stroke	50 cm <sup>3</sup>
DN 500 (20") and DN 600 (24")		Large	0.5 cm <sup>3</sup> /Stroke	50 cm <sup>3</sup>

<sup>1)</sup> Until April 2014 the large pump had a volume /stroke of 1.0 cm<sup>3</sup> and a 120 cm<sup>3</sup> container This pump can be identified by the square shape of the pump housing

The lubrication system is specially designed for high-pressure applications. The force to operate the pump is minimal. The lubrication system is exposed to the full gas pressure. To prevent gas leakage, the pump is equipped with an internal non-return valve. A second non-return valve is installed in the lubrication line that goes into the meter body.

The lubrication system is designed to allow lubrication even under hostile environment conditions. An internal anti-freeze feature counteracts the small amounts of moisture that may be present either in the oil or the reservoir. The turbine is shipped with a small amount of oil in each bearing. This amount is only sufficient for initial operation at the factory and calibration.

Lubrication before start-up (for meters with a lubrication system)

The prescribed lubricant for the IGTM-CT is ISOFLEX PDP 38 or equivalent. *vemm tec* supplies an amount of bearing lubrication oil with each IGTM-CT.

For IGTM-WT as well as for gas temperatures  $\geq$  -10 °C lubricant Shell MORLINA S2 or equivalent can be used. This initial quantity is sufficient to cover two years of operation for normal applications. For transporting and handling purposes, each turbine is supplied without any oil in the pump and lubrication system. Before start-up operation you must proceed as followed:

- Step 1: Fill the reservoir with oil. Close the cover of the reservoir after filling to avoid polluting the oil.
- Step 2: Apply the initial amount of oil to the lubrication system with the number of strokes of the oil pump shown in the table below. One stroke is a push forward and back to the original position. The push button of the small oil pump can be accessed by removing the hex-cap of the pump.
- Step 3: Check the oil level (during initial lubrication it will be necessary to refill the reservoir). Close the cover of the reservoir after filling to avoid polluting the oil.

Table 3: Lubrication quantity at start up

Meter Size Initial Iubrication IGTM-CT (before first use)		Initial lubrication IGTM-WT (before first use)
DN 50 (2")	$24 \text{ Strokes} = 3.4 \text{ cm}^3$	N/A
DN 80 (3")	$26 \text{ Strokes} = 3.7 \text{ cm}^3$	N/A
DN 100 (4")	$26 \text{ Strokes} = 3.7 \text{ cm}^3$	N/A
DN 150 (6")	8 Strokes = 4 cm <sup>3</sup>	29 Strokes = 4.1 cm <sup>3</sup>
DN 200 (8") 12 Strokes = 6 cm <sup>3</sup>		29 Strokes = 4.1 cm <sup>3</sup>
DN 250 (10")	12 Strokes = 6 cm <sup>3</sup>	
DN 300 (12") 20 Strokes = 10 cm <sup>3</sup> <sup>1)</sup>		
DN 400 (16") 20 Strokes = 10 cm <sup>3 1)</sup>		
DN 500 (20") 20 Strokes = 10 cm <sup>3 1)</sup>		
DN 600 (24")	20 Strokes = $10 \text{ cm}^{3}$ <sup>1)</sup>	

<sup>1)</sup> Applicable for the round shaped pump fitted from April 2014. For the older square shaped pump 10 strokes provide the required 10 cm<sup>3</sup>

To achieve a longer meter life, regular lubrication is required. Typically, for a clean, dry-gas application, lubrication is recommended every 3 months. For dirty gas, more frequent lubrication is required. Specification of the lubrication oil and quantities follow hereafter. After the initial lubrication the bearings must be lubricated at regular intervals as described in Section 4.1. Lubrication not only reduces the friction of the bearings, it also flushes small particles that may have collected around the bearings over time.

### 2.3.2 Required upstream and downstream length

The IGTM should be installed in a straight pipe section of equal nominal diameter to the meter. The meter axis should be concentric and identical to the piping axis. Gaskets immediately upstream and downstream of the meter should not protrude into the stream.

The IGTM-CT is (MID) approved for operation with an upstream pipe length of only 2 times of the nominal diameter of the gas meter. For the best results, we **recommend** a 5 diameter long straight upstream (inlet) section without valves, filters, control valves, reducers, T-pieces, and safety shut-off valves.

The straight downstream (outlet) section is **recommended** to be 1 diameter long, for best results 3 diameters. Some standards require the temperature transmitter to be installed in this section. (See Section 2.3.6 in this manual.)

For customer specific meter applications, other upstream and downstream lengths may be required.

## 2.3.3 Flow direction and orientation

The flow direction of the meter is indicated on the meter with an arrow. The index head is standard mounted for flow direction from left to right, unless specified differently at the time of your order.

#### CAUTION: Reverse flow will damage the meter.

The meter is equipped as standard for horizontal installation. However, meters up to DN 100 (4") can also be operated vertically. In this case the oil pump must be equipped with an adapter for vertical operation. The flow direction needs to be indicated when ordering an IGTM. Meters with permanent lubrication can either be installed horizontally or vertically. For options, please consult your sales agent.

Meters that are operating under EC-MID approval can only be operated horizontally!

#### 2.3.4 Volume conversion

**vemm tec** can provide you with flow conversion devices, ranging from a converter with only basic features to a sophisticated flow computer. The latter has features like curve corrections, valve controls, gas chromatograph readouts, and other customer specified functions.

We offer such devices on your request. Please enquire for more details.

A flow conversion device connected to the IGTM will convert the volume measured at actual conditions to volume at base conditions with the following formula (nomenclature according to EN 12405).

Take care that the flow conversion device can measure the highest frequency that the gas turbine meters can generate: That is the frequency that occurs at  $Q_{max}$  multiplied by 1.2 for cases of over speeding.

Formula 1: Volume conversion

$V_{b}$ = Volume at base conditions	(converted volume)	[m <sup>3</sup> ]
V = Volume at measurement conditions	(unconverted volume)	[m <sup>3</sup> ]
(number of pulses from the gas meter divided by th	ne gas meter's k-factor)	
p = Absolute gas pressure at measurement conditions	(actual pressure)	[bar abs]
$p_b$ = Absolute pressure at base conditions	(or other specified pressure)	[1.01325 bar]
$T_b$ = Absolute temperature at base conditions	(or other specified temperature	e) [273.15 K]
T = Absolute gas temperature at measurement condition	ons	[K]
$Z_b$ = Compressibility factor of the gas at base conditions	i	
	and all all and a	

Z =Compressibility factor of the gas at measurement conditions

## 2.3.5 Connection pressure transmitter at p<sub>m</sub> -point

A pressure tap is located on the meter housing to enable the measurement of the static pressure upstream of the turbine wheel. It must be shut before start up and during operation either with a screw plug or with connection to a pressure transmitter.

The pressure measurement point is marked as  $p_m$  (or before  $p_r$ ): pressure at measurement conditions. The bore is 3 mm and perpendicular to the wall. It has a G 1/8 cylindrical female thread and for the IGTM-CT a fitting for tubing with 6 mm diameter. Connection to 6 mm stainless steel tubing (standard) is recommended. If the pressure tap is not needed, it must be sealed with a G 1/8 dummy plug. When ordered, the IGTM-CT can have a pressure tap with  $\frac{1}{2}$ " NPT or M12X1.5 female thread (not possible for all models).

# NOTE: The tubing connection of 6 mm diameter is NOT identical with 1/4" diameter tubing (6.35 mm). Replace the inner ring or the connector if the tubing is non-metric.

The pressure reference point should be used for connecting the pressure transmitter of the flow converter or flow computer in order to convert the measured volume to base conditions, called standard or normal conditions in some countries. The  $p_m$ -point is used during the determination of the meter calibration curve and this  $p_m$ -point should be used for custody transfer applications. Using a different pressure point may cause small errors in the flow measurement and the conversion to base conditions.

## 2.3.6 Temperature measurement

The temperature transmitter is required when a flow converter or flow computer is used to convert the measured volume to base conditions, called standard or normal conditions in some countries. The temperature sensor should be installed in a thermo-well.

As an option, the IGTM-CT can be equipped with an integrated thermo-well. As an alternative, the temperature measurement shall be located downstream of the meter. *vemm tec* recommends 1 to 3 meter diameters distance downstream from the meter, but not more than 600 mm. No pressure drop should occur between the temperature device and the meter. The temperature sensor is recommended to be within the centre third of the pipe and be protected from heat transfer from the external environment.

A second thermo-well close to the other one may be added to allow in-line checking of the main temperature sensor.

Some specific models of the IGTM are equipped with thermo-wells integrated in the meter body. Do not replace these thermo-wells by other models and **do not remove** these thermo-wells when the meter is pressurized.

### 2.3.7 Density measurement

When a line density meter is used, the above mentioned requirements for pressure and temperature should be followed for the location of the density meter. Most density meters will be installed in a separate pocket, which was welded into the pipe-line. The density meter will typically be installed in the downstream section of the IGTM (3 – 5 meter diameters) to measure the density at operating temperature conditions. The sample gas flowing through the density meter should be taken from the  $p_m$ -point of the IGTM to ensure the density is measured at the correct line pressure.

Please refer to the recommendations of the density meter manufacturer for optimal results.

Base density can be measured at any point in the installation, as long as the gas sample flowing through the density meter is representative of the actual flowing gas.

#### 2.3.8 Energy measurement

In order to calculate the energy content of the passed gas, the converted volume is to be multiplied by the heating value. The volume conversion is described in Section 2.3.4. The heating value of the gas can be determined in several ways. The most commonly used methods are:

- On-line analysis with a process gas chromatograph
- On-line analysis with a calorimeter
- Laboratory analysis of a collected sample
- Calculation by pipeline simulation

The PTZ-BOX electronic volume converters can calculate the heating value from the gas composition and as such it can calculate the energy content of the passed gas.

#### 2.3.9 Index head and pulse transmitters

The IGTM index head is rated IP 67 after IEC 60529, which is dust-tight and protected against water jets. The index head is provided with a special breathing filter that equalizes pressure differences between index head and environment. Due to these provisions the IGTM can be installed outside but we recommend installing a simple sun and rain shield above the index head. All IGTM sockets with properly fitted caps or connectors for pulse transmitters are rated IP 67.

Every index head is equipped with high-quality bearings and polished gears for low-friction. To ensure that each revolution of the mechanical counter corresponds with a known volume, a final factory flow test is performed. As a part of this test, the ratio of the gears is checked and if necessary adjusted. These gears are inside the index head and the head is lead-sealed to prevent unauthorized access.

The mechanical counter totalizes the actual volume passing through the meter. A large eight-digit (non-resettable) display shows the totalized volume (refer to Figure 8)

For easy reading of the volume indicated at the display, the index head can be turned through 350° without violating the lead seal (refer to Figure 9). To turn the index head loosen the two Allen screws, located left and right from the front (1 and 2) and the screw at the back (3) (all on the upper cover), and turn the upper cover carefully with two hands without lifting it. Tighten the nuts after positioning with low force.

#### CAUTION: Do not break the seals when turning the index head.

Your IGTM gas turbine meter is supplied with one or more pulse transmitters. The pulse signals can be connected to a flow computer or a volume converter. Two types of pulse transmitters are available: LF (low frequency) reed switches and HF (high frequency) NAMUR proximity sensors. Both LF and HF sensors can be fitted in the index head if specified as part of the order. If your meter is supplied with pulse transmitters at the meter body, these transmitters are HF sensors.

#### *Figure 8: Mechanical counter: reading the index head display*

Figure 9: Orientation change of the index head \*)

\*) required tools: Allen Wrench 2 mm. Flat Screwdriver No 4

Code	Description	Maximum frequency *	Remarks
1R1, 2R1	Reed switch	< 1 Hz	1R1 standard, 2R1 optional **
1R10, 2R10	Reed switch, frequency x 10	< 10 Hz	1R10 and/or 2R10 optional **
HF3, HF4	HF NAMUR sensor (at the index head)	< 200 Hz	HF3 (for CT model standard***, WT model optional), HF4 optional
HF1	HF NAMUR sensor	< 4.5 kHz	optional for CT model (at the turbine wheel)
HF2	HF NAMUR sensor	< 4.5 kHz (equal to HF1)	optional for CT model (DN50 and DN80 at turbine wheel and ≥ DN100 at the reference wheel)

\* The maximum pulse frequency depends on meter size: Please refer to Table 14 for typical values.

\*\* A maximum of two reed switches can be supplied per meter.

\*\*\* Optionally IGTM-CT can be supplied without HF3 sensor

\* Alternative pin allocation is possible: refer to the pulse label at the index head for final information.

Figure 11: PIN allocation sensors HF1 and HF2

(View at male socket at the meter)

 $\begin{pmatrix} 1 & 2 \\ \circ & \circ \\ \end{pmatrix}$  1 = NAMUR + SIGNAL 2 = NAMUR - SIGNAL

Sockets for the pulse transmitters in the index head are female and located at the back of the index head. Sockets for the pulse transmitters of HF1 and HF2 sensors are male. A label is located alongside each of the socket(s), which indicates the type of pulse transmitter, the k-factor (number of pulses per cubic meter) and the connecting pins and their polarity. The details of the pulse transmitters in the meter body are also shown on the nameplate at the index head.

The corresponding connectors can be ordered additionally with your meter. The connectors are shipped unassembled, to make the field connections. If required we can supply the connectors assembled and connected to a cable of the requested length.

You will find more information about the sensor types and electrical connection schematics in the following sections of this manual.

## 2.3.10 Specification of reed switches (R1 or R10 in the index head)

As a standard, the index head is equipped with one low frequency reed contact closure switch (1R1), which gives one pulse per revolution of the last digit roll of the counter. Depending on the meter size, the volume per pulse can be 0.1, 1, 10 or 100 m<sup>3</sup> (see Table 14). As an option, a second reed switch (2R1) can be provided.

Alternatively, the meter can be equipped with one or two reed switches that give 10 pulses per revolution of the last digit roll of the counter (1R10, 2R10). A maximum of two low frequency switches can be mounted in the index head.

A reed switch generates a low frequency contact closure signal. This signal can be used to connect to a flow converter (often battery powered) which may be located beside the meter in the hazardous area. Reed switches require no power for the circuit to generate pulses.

A 100 Ohm resistor is connected in series with the reed switch. If the reed switches are connected to non-intrinsically safe devices, a barrier should be used.

Please refer to the connector diagram in Figure 10, Figure 11, Figure 15 and electrical connection schematics in Section 2.3.12.

## 2.3.11 Specifications of high frequency sensors (HF1 to HF4)

A proximity sensor generates a high frequency signal according to NAMUR EN 60947-5/6 standard (8.2 V, direct current switching between 1.2 and 2.1 mA). These sensors require external power and therefore cannot be used with battery powered devices.

The sensors HF1, HF2, HF3, and HF4 are electrically identical. You will find the connector diagram in Figure 10 and electrical connection schematics in Section 2.3.12.

One high frequency proximity sensor (HF3) is provided standard in the index head at the CT models (but can be removed upon request). This sensor provides a middle range frequency signal (< 200 Hz) based on a rotating impulse disk. The detection is based on standard proximity switches. The signal is intrinsically safe and complies with the NAMUR standard (EN 60947-5/6) for intrinsically safe signals. A second high frequency sensor (HF4) can be installed optionally in the index head. The HF4 sensor generates pulses with equal frequency as the HF3 sensor.

In addition, your IGTM-CT may be equipped with one or two high frequency sensors located in the body of the turbine meter (HF1, HF2). The HF1 sensor directly generates a pulse for each passing blade of the turbine wheel, the HF2 sensor for CT models DN100 or lager works with a reference wheel. For CT models DN50 and DN80 the HF2 sensor is available for meters with carbon steel body and works with the turbine wheel.

The following checks can be done with the HF pulses.

- For a check on signal integrity both HF1/HF2 combined, or HF3/HF4 combined, can be connected to your flow computer. The number of HF3 and HF4 pulses must be identical. In the standard application the HF2 generates the same number of pulses as the HF1.
- For checking if no turbine wheel blade is missing, the combination of HF1 and HF2 must be used. The number of pulses generated by HF1 and HF2 is the same (in the standard gas meter).
- As an option, your meter can be specially equipped for HF1 and HF2 pulses with a specific phase shift. This allows recognition of the gas flow direction, and thus detection of reverse flow.

The pulse frequency at maximum flow of HF sensors depends on the meter size. Typical values are shown in Table 14. The k-factor [Imp/m<sup>3</sup>] for your gas turbine meter is determined during calibration and is shown on a label on the index head and the calibration certificate. This k-factor is specific for each meter and corresponds with specific gears in the index head. The factor determined by the calibration is the one that should be used in your calculations and flow correcting devices.

## 2.3.12 Electrical connection schematics for pulse transmitters

The pulse transmitters used are indicated on the labels beside the connectors. Please refer to Table 4 with the available pulse transmitters and to the connector diagram in Figure 10 and Figure 15. For specific applications it is possible that the connector has a non-standard wiring and pin allocation. In these situations a clear indication at the gas meter pulse label is provided. Examples of connections are given in Figure 12, Figure 13, and Figure 14.

# CAUTION: For use with hazardous gas in potentially hazardous area (EX-ZONE), always hook up the meter to intrinsically-safe circuits.

The interface/barrier between hazardous and safe area operations must be suitable and can be purchased from **vemm tec**. Please refer to the recommended safety barriers in Table 13 for connecting the HF sensors to non-intrinsically safe equipment.

An analogue signal (4 - 20 mA) can be generated by using an IS frequency-current-(F/I)-converter connected to the sensor. Please refer to Table 13.

#### 2.3.13 Required settings for flow computers and flow converters

The k-factor setting for your flow computer/flow converter is shown on the label beside the appropriate connector. These impulse values are the same as the values shown on the calibration certificate/initial verification sheet. The values given on the label are the results of calibration and these values should be used in any volume converting device connected to the turbine meter.

# WARNING: Some devices use the k-factor [Imp/m<sup>3</sup>], and other devices use the reciprocal value [m<sup>3</sup>/Imp]. Please check carefully which value should be used in your device.

Figure 12: IGTM scheme with location of pulse transmitters

Figure 13: Connection diagram for low frequency reed switch

Figure 14: Connection diagram for high frequency sensors

In the event your computer provides curve correction, k-factors should be set for several flow rates. Please refer to the manual of your flow computer for applying these factors.

For reed switches, the pulse length is factory set to switch high between the digit 6 and 9 on the last digit roll of the counter. Your flow convertor should be equipped with a debouncing feature or have a low pass filter so that it is not affected by a slightly bouncing signal. The sensor connection diagram of the IGTM; shown in Figure 15 indicates that the IGTM already have a simple de-bouncing feature in the internal circuit.

Alternative pin allocation is possible: refer to the pulse label at the index head for final information.

Figure 15: Internal sensor connection diagram

#### 3 **OPERATION**

## 3.1 Accuracy

#### **IGTM-CT**

Standard accuracy limits for all IGTM-CT models are (in accordance with the MID and other EC directives and with many other countries regulations):

 $\begin{array}{l} \pm \ 1 \ \% \ for \ Q_t \leq Q \leq Q_{max} \\ \pm \ 2 \ \% \ for \ Q_{min} \leq Q < Q_t \end{array}$ 

Were:

Q is the actual flow [m<sup>3</sup>/h] Q<sub>max</sub> is the maximum flow of the meter [m<sup>3</sup>/h]  $Q_{min}$  is the minimum flow of the meter [m<sup>3</sup>/h]  $Q_t$  is the transition flow were the accuracy changes [m<sup>3</sup>/h]; according to EN 12261: for a flow range 1:20,  $Q_t = 20 \% Q_{max}$ for a flow range 1:30,  $Q_t = 15 \% Q_{max}$ 

As an option for the CT model the accuracy limits can be improved to:

 $\pm$  0.5 % for  $Q_t \le Q \le Q_{max}$  $\pm$  1.0 % for  $Q_{min} \le Q < Q_t$ 

Depending on the applicable approval, temperature limitation may apply!

Between  $Q_t$  and  $Q_{max}$ , the linearity of metering at atmospheric pressure is typically  $\leq 0.5$  %. It can be better if requested. The linearity at test pressures > 5 bar abs is typically  $\leq$  0.5 % for meters  $\leq$  DN 100 (4"), between Q<sub>t</sub> and Q<sub>max</sub>. It is typically  $\leq$  0.3 % for meters > DN 100 (4"). That is according to EN 12261.

The repeatability of the IGTM is ± 0.1 % or better. The EN 12261 stability requirements allow a span of 0.2 %. The reproducibility of metering is also  $\pm 0.1$  % or better.

Specific accuracy or linearity specifications can be offered on request.

#### **IGTM-WT**

The standard accuracy limits for the IGTM-WT models are:

 $\pm$  1.5 % for 0.2Q<sub>max</sub>  $\leq$  Q  $\leq$ Q<sub>max</sub>  $\pm$  3.0 % for  $Q_{min} \le Q < 0.2Q_{max}$ 

## 3.2 Operating flow range

The flow range of the IGTM-CT according to the MID approval, is 1:20 or 1:30 ( $Q_{min}$  to  $Q_{max}$ ).

According to the 71/318/EEC (old style EEC) approval the flow range of the IGTM-CT, is 1:20 ( $Q_{min}$  to  $Q_{max}$ ). With small meter size DN 50 (2"); with special designs, or with low relative density gases (relative density < 0.6), the range may be restricted to 1:10 or 1:5. Meters with improved ranges (up to 1:40) are available in certain sizes. These meters are specially prepared. Please refer to Table 15.

The turbine meter still operates properly far below Q<sub>min</sub>. However, the accuracy at these low flow rates decreases.

## 3.2.1 Flow range at elevated pressure

At higher operating pressure, the density of the gas increases. With increasing density, the available driving force increases. The increased momentum reduces the relative influence of the bearing friction. The additional momentum increases the rotor drive, which in turn decreases the minimum flow rate at which the meter will remain within legal error limits at low flow rates. Effectively, the range of the IGTM increases;  $Q_{max}$  remains the same,  $Q_{min}$  reduces. The new  $Q_{min}$  ( $Q_{min,m}$ ) can be approximated with the following formula (See also Figure 16).

Formula 2: Flow range at elevated pressure

$$Q_{min,m} = Q_{min} \sqrt{\frac{\rho_{air,b} \cdot p_b}{\rho_b \cdot p_m}}$$

Q <sub>min,m</sub>	=	Minimum flow rate at actual pressure	(approximated value)	[m³/h]
Q <sub>min</sub>	=	Minimum flow rate as specified	(see Table 14)	[m³/h]
$\rho_{\text{air,b}}$	=	Density of air at base conditions		[1.293 kg/m <sup>3</sup> ]
$\rho_{\rm b}$	=	Gas density at base conditions		[kg/m³]
pb	=	Absolute pressure at base conditions		[1.013 bar abs]
p <sub>m</sub>	=	Absolute gas pressure at measurement c	onditions (actual pressu	ıre) [bar abs]

Figure 16: Turn down ratio at elevated pressure

## 3.2.2 Overload

The IGTM is designed to compensate for a limited time of operation with a flow rate overload of maximum 20 % above  $Q_{max}$ . The overload must occur gradually and without pulsations. In the case that an electronic volume converter is connected it need to be ensured that this volume converter specifications enables the measurement of the 20% higher frequency of the pulse output of the gas meter in overload conditions.

### 3.3 Temperature range

Different approvals and standards allow different temperature ranges. According to all these approvals all meters are at least suitable for a temperature range of -20 to +55 °C (gas temperature and ambient temperature), which equals -4 °F to +131 °F. For customer specific applications, other temperature ranges may apply. In case you have a specific demand for the temperature range, please indicate required approvals, region of installation and requested sensors. Under MID approval the temperature may not exceed -20 to +55 °C.

## 3.4 Maximum pressure

Flange rating and maximum operating pressure of your meter are indicated on the main label at the meter and in the calibration certificate. IGTM gas turbine meters are available for the following maximum pressures as specified per CE-PED regulations.

Flange rating	Maximum operating pressure [bar (g)]
ANSI 150#	20
ANSI 300#	52
ANSI 600#	103 (100 for certain approvals)
PN 10	10
PN 16	16
PN 25	25
PN 40	40
PN 63	63
PN 100	100

Table 5: Flange rating and maximum operating pressure

According to CE-MID (applicable for the IGTM-CT sold under MID approve) regulations the pressure range allowed for the measurement depend on the calibration pressure and is indicated at the meter.

## 3.5 Pressure loss under operating conditions

The pressure loss at actual pressure and actual flow can roughly be calculated using the values from Table 16 and the following formula. This formula assumes a purely quadratic behaviour which is not exactly the case due to fluid dynamic effects.

Formula 3: Pressure loss under operating conditions

$$\Delta p \approx \Delta p_r \cdot \frac{\rho}{\rho_r} \cdot \left(\frac{Q}{Q_{max}}\right)^2$$

ΔP	=	Pressure loss at measurement conditions	(with the measured gas)	[mbar]
$\Delta P_r$	=	Pressure loss at reference conditions	(see Table 16 at 100 % flow	v) [mbar]
ρ	=	Density at measurement conditions (actual den	sity of the measured gas)	[kg/m³]
ρ <sub>r</sub>	=	Density at reference conditions	(with natural gas)	[0.8 kg/m³]
Q	=	Actual flow rate of the measured gas		[m³/h]
Q <sub>max</sub>	=	Maximum flow rate of the gas meter	(see Table 16)	[m³/h]

## 3.6 Material of construction

The standard materials of construction are listed in Table 6. Some gas types require special materials, please check the material compatibility (Please refer to Table 11) or enquire at **vemm tec**.

Table 6: Standard material specification

Part description	Material description		
Housing	IGTM CT		
	Ductile iron (EN-GJS-400-18-LT) Max: DN 200 and PN16/ANSI150 or carbon steel (cast or welded) or stainless steel (on request)		
	IGTM-WT		
	Aluminium, anodized (EN AW 5083)		
Flow conditioner	Aluminium		
Turbine wheel	Aluminium		
Metering insert	Aluminium		
Bearing block	Aluminium		
Bearings	Stainless steel		
Shafts	Stainless steel		
Gears	Stainless steel or synthetic material		
Magnetic coupling	Stainless steel		
Index head	Aluminium		
Counter	Synthetic material		
Counter plate	Aluminium		

## 3.7 Gas composition and flow conditions

The standard IGTM can be used for all non-aggressive gases, like natural gas, methane, propane, butane, city and fabricated gas, air, nitrogen, etc. (Please refer to Table 11).

Special designs are available for aggressive gases like sour gas, biogas, and oxygen. Never use a standard meter for these applications without a **vemm tec** confirmation.

The IGTM reaches its full potential when the turbine rotor is subjected to uniform and undisturbed gas velocity within the meter housing. The integrated flow conditioner of the IGTM-CT is designed to comply with EN 12261, ISO 9951, and OIML perturbation test conditions. It also creates stable flow conditions for the turbine rotor. In practice, the performance of the IGTM will also slightly depend on the installation. The IGTM is substantially less sensitive for effect from flow disturbances than other devices. In poorly designed gas-metering installations, some conditions can lead to increased error of the meter.

Pulsating gas flow and intermittent flows should be avoided. Pulsating or intermittent flow leads to under or over registration due to rotor inertia. Large and fast pressure fluctuations should also be avoided. When filling a piping section, always let the pressure and flow increase slowly to avoid overloading. Open valves very carefully and slowly. Preferably install bypass lines over ball valves to fill the line before opening the valve.

Heavy vibrations must be avoided: Mechanical factors: Class M1. Heavy electromagnetic fields need to be avoided: Electromagnetic factors: Class E2

The gas flow must be free from contaminants, water, condensate, dust and particles. These can damage the delicate bearings and the rotor. When dust collects over time, it has an adverse effect on the metering accuracy. Dirty gases should be filtered with a 10 micron particle filter.

Lubricate your IGTM before start up and at regular intervals during operation (see Sections 2.3.1 and 4.1).

Turbine meters are occasionally over-dimensioned or oversized. This may be due to higher future flow rates or seasonal fluctuations. When a gas turbine meter operates below its stated minimum flow rate, this typically results in a negative error. Under high pressure conditions this effect is partially compensated (Section 3.2.1).

## **4 MAINTENANCE**

## 4.1 Regular lubrication

**On request**, IGTM-CT up to DN 100 (4") can be provided with permanently lubricated bearings. IGTM-WT up to DN100 (4") are always equipped with permanent lubricated bearings.

Each **standard** IGTM-CT is equipped with an oil pump. For details about the lubrication system, please refer to Section 2.3.1. The meters that are provided with a lubrication pump must be regularly lubricated with the oil quantities detailed in Table 7. For lubrication, the cap on the oil reservoir should be unscrewed and the reservoir can be carefully filled with oil. The reservoir may need refilling during the lubrication session. Always close the cap of the reservoir to avoid contaminating the oil with dirt and moisture.

In standard applications (clean and dry gas, nominal meter usage), the lubrication interval is every 3 months. When the gas is dirty or when the meter is operated at design extremes more frequent lubrication is recommended (see Table 7).

Gas turbine meters should not be lubricated shortly before calibration.

Table 7: Periodical lubrication quantities

Meter size	Periodical Lubrication IGTM-CT	Periodical Lubrication IGTM-WT	Increased Lubrication Frequency <sup>2)</sup>		
DN 50 (2")	7 Strokes = $1 \text{ cm}^3$	N/A	bi-weekly		
DN 80 (3")	7 Strokes = $1 \text{ cm}^3$	N/A	bi-weekly		
DN 100 (4")	10 Strokes = $1.4 \text{ cm}^3$	N/A	bi-weekly		
DN 150 (6")	6 Strokes = $3 \text{ cm}^3$	22 Strokes = 3.1 cm <sup>3</sup>	bi-weekly		
DN 200 (8")	6 Strokes = $3 \text{ cm}^3$	22 Strokes = $3.1 \text{ cm}^3$	bi-weekly		
DN 250 (10")	$6 \text{ Strokes} = 3 \text{ cm}^3$	-	weekly		
DN 300 (12")	6 Strokes = $3 \text{ cm}^{3 \text{ 1}}$	-	weekly		
DN 400 (16")	6 Strokes = $3 \text{ cm}^{3 \text{ 1}}$	-	daily		
DN 500 (20")	6 Strokes = $3 \text{ cm}^3$	-	daily		
DN 600 (24")	6 Strokes = $3 \text{ cm}^3$	-	daily		

<sup>1)</sup> Applicable for the round shaped pump fitted from April 2014. For the older

square shaped pump 3 strokes provide the required 3 cm<sup>3</sup>

<sup>2)</sup> for special gases, see Table 11

WARNING: Over-lubrication (interval frequency and quantity) may cause dirt accumulation in the downstream path of the oil. Excessive lubrication may cause metering inaccuracy at very low flow rates.

## 4.2 Spare parts

No commissioning spare parts are required. Under normal operating conditions, no operational spare parts are required. Under extreme operating/environmental conditions or where meters are situated in less accessible areas, spare part storage as mentioned in Table 12 can be considered. For special circumstances, dedicated spare parts lists may be applicable.

The following 2 years operation spare parts might come into consideration (part.-nos. depending on diameter and G-rate):

• Lubrication oil 50 ml

- Set of O-rings
- Connector for pulse sensors (male)
- Electronic revision set for index head

A repair of defective meters is preferably performed by the manufacturer; a new calibration is needed afterwards. Spare parts and labour hours will be quoted after inspection.

For custody transfer purposes and for best performance after repair, gas turbine meters should be calibrated at an approved calibration facility. See Section 4.4 in this manual.

## 4.3 Spin test

For a fast, limited test of the meter condition, a spin test can be performed.

Please allow the meter to reach ambient temperature, and ensure a relatively draft-free environment to conduct the test. Do not lubricate the meter before performing a spin test.

With the meter out of the line, the meter rotor can be blown to rotate at close to maximum speed by applying compressed air (with an air gun) from the inlet side of the meter. The air will rotate the rotor. Exposure time minimum is 10 – 15 seconds.

At a time t = 0 the flow of air should be stopped. At the same time, a stopwatch is activated. The rotor should be left to spin freely until it comes to a complete stop: no more forward rotation. The time in seconds required for the rotor to come to a complete standstill is called the spin-down time.

A significant decrease of spin-down time indicates either a bearing problem or a significant build-up of dirt or sludge in the bearings. The spin-down time gives a rough indication of the meter bearing condition. If the time has dropped more than 50 % from the indicated values in Table 8, a bearing replacement is required. The spin test gives an indication of the meter performance and accuracy at the low flow rates. A reduced spin down does not necessarily indicate a loss of accuracy at middle or high flow rates; it indicates a loss of range and accuracy at low flow rates.

Table 8: Nominal spin-down times (with mechanical index head and standard bearings)	Table 8: Nominal	spin-down times	(with mechanical	' index head and	standard bearings)
---	------------------	-----------------	------------------	------------------	--------------------

Meter Size	Nominal spin-down time
DN 50 (2")	50 seconds
DN 80 (3")	120 seconds
DN 100 (4")	240 seconds
DN 150 (6")	> 360 seconds
DN 200 (8")	> 360 seconds
DN 250 (10")	> 360 seconds
DN 300 (12")	> 360 seconds
DN 400 (16")	> 360 seconds
DN 500 (20")	> 360 seconds
DN 600 (24")	> 360 seconds

#### 4.4 Recalibration

Legal requirements for recalibration are different in each country. If no recalibration requirements apply, **vemm tec** suggests a recalibration period of 6 - 12 years. This period should be more frequent when operating in harsh conditions, such as dirty gas or pulsating flow. **vemm tec** can perform legal verifications or factory calibrations with ambient air. When the meter is checked or reconditioned, a new calibration should also be performed. Do not lubricate a meter just before calibration!

In addition, you can recalibrate the meter with high pressure gas.

Please refer to Section 1.8.4.

# NOTE: If at any time the meter is recalibrated and the correction gears in the index head are changed, the k-factor for the HF sensors must also be adjusted.

#### Example

For custody transfer, a standard IGTM with an oil pump may be used in Germany for a 12-year period without recalibration. A permanently lubricated IGTM without oil pump may be used in Germany for 8 years without recalibration. Other countries have different regulations.

## **5 WARRANTY**

IGTM Gas Turbine Meters supplied by **vemm tec** are guaranteed against defects due to faulty material or workmanship for 12 months from the delivery date of the Goods, according to the "General Terms and Conditions of Business (GTC) of the **vemm tec** Messtechnik GmbH (**vemm tec**) for Export", unless otherwise agreed in writing.

Replacement parts provided under the terms of this declaration are warranted for the remainder of the warranty period applicable to the Goods, as if these parts were original components of the Goods.

- This warranty does not extend
- (i) to non-compliance to the "Installation, Operation and Maintenance Manual"
- (ii) to damages caused by unsuitable or incorrect use, faulty installation, or operation by the Customer or third parties, natural wear and tear, faulty or negligent treatment or maintenance, the use of unsuitable operating or substitute materials, deficient assembly and damages caused by chemical, electronic or electric influence;
- (iii) to equipment, materials, parts and accessories manufactured by others;
- (iv) to correctness of any externally performed calibrations, either at ambient conditions or at elevated pressure.
- The warranty also becomes invalid when devices supplied with our seal no longer possess the original, undisturbed seal.

*vemm tec* accepts no liability for Goods being fit for the purpose required by the Customer unless it shall have been given full and accurate particulars of the Customer's requirements and of the conditions under which the Goods are required to be used.

Upon written notification received by **vemm tec** within the above-stated warranty period of any failure to conform to the above warranty, upon return prepaid to the address specified by **vemm tec** of any non-conforming original part or component, and upon inspection by **vemm tec** to verify said non-conformity, **vemm tec** at its sole option either shall repair or replace said original part component or complete IGTM Gas Turbine Meter without charge to the Customer, or shall refund the Customer the price thereof. Externally performed calibrations are not covered by warranty. However, if **vemm tec**'s inspection fails to verify the claimed non-conformity the Customer will be liable for any costs incurred by **vemm tec** in investigating the claimed non-conformity. The remedies set forth herein are exclusive without regard to whether any defect was discoverable or latent at the time of delivery of the Goods to the Customer.

Goods, once delivered, may be returned to **vemm tec** only with prior written authority from **vemm tec** unless those Goods are accepted by **vemm tec** as being defective as to the material or workmanship. In the event of a return authorized by **vemm tec**, **vemm tec** shall have the right to charge carriage to and from the delivery location and the costs involved in the removal of the Goods from the Customer's premises.

All further claims of the Customer against **vemm tec** as well as our subcontractors are – in accordance with the law – excluded, including compensation for consequential damages and damages based on repairs and replacements, except in the case of conscious negligence or compulsory liability for the lack of guaranteed qualities.

Claims for warranty and service need to be addressed to the **vemm tec** office or to the **vemm tec** agent where the meters originally were ordered.

## Many national standards and laws are based on the above.

Table 10: List of approvals

ISO 9001 and 14001

*vemm tec* Messtechnik GmbH is certified according to ISO 9001:2015, (see Figure 17) and ISO 14001:2015.

#### **Metrological approvals**

IGTM Gas Turbine Meters are legally approved for custody transfer within the European Economic Community according to Directive 2014/32/EU of the European Parliament and of the Council with examination certificate DE-11-MI002-PTB005, issued by Physikalisch-Technische Bundesanstalt (PTB) [Germany]. Refer to Table 15 for approved sizes and ranges.

In addition, approvals in several countries have been granted and are in process as a continuing effort. Approvals are currently available for the following countries:

Algeria (ONML), Brazil (INMETRO) China (NIM), Czech Republic (CMI) Germany (PTB), Hungary (NOM) Italy (MSE), Malaysia (SIRIM) Romania (BRML), South Korea (MPI) Others are in progress.

#### **ATEX (explosive Atmosphere)**

The Reed switch sensors are considered to be simple apparatus and as such do not require ATEX approval. The pulse generators applied in HF1 to HF4 are approved according to ATEX for the use in hazardous areas subject to explosive gases. In all cases the sensors should be connected to an intrinsically safe circuit after NAMUR (EN 60947-5/6). The following certificates for our sensors have been obtained (choice of sensors depending on model and manufacturing possibilities) HF1/HF2: PTB 01 ATEX 2192 (seeFigure 4) HF3/HF4: BVS 08 ATEX E026 (see Figure 4) HF1 for DN50: PTB 00 ATEX 2048 X (see Figure 4)

Not MID approved ranges:

All combinations are available in the standard accuracy: ± 1 % for  $Q_t \le Q \le Q_{max}$ ± 2 % for  $Q_{min} \le Q < Q_t$ 

<sup>1)</sup> Flow range 1 : 5

<sup>2)</sup> Flow range 1 : 9

<sup>3)</sup> Flow range 1 : 10

<sup>4)</sup> Flow range 1 : 14

<sup>5)</sup> Not MID approved

The **bold** printed combinations are also available with improved accuracy:  $\pm 0.5$  % for  $Q_t \le Q \le Q_{max}$  $\pm 1$  % for  $Q_{min} \le Q < Q_t$ 

Remark: Not all type approvals allow the technically possible ranges as mentioned above. In these cases the calibration certificate will state the ranges according to the type approval but the calibration will be performed at the range as mentioned above.

\* The size E is the distance between the centre line of the gas meter and the outside of the lubrication pump.

Specific Remarks

Specific Remarks

# SAFETY INSTRUCTIONS AND WARNINGS

#### Please refer to section 2.2 for specific warnings in the EC Pressure Equipment Directive.

The IGTM gas turbine meter supplied to you is a sensitive, high-quality metering instrument and should be handled with care. The smaller meters (DN 50 (2") to DN 100 (4")) should be lifted or transported with a strap. Larger meters (DN 150 (6") and up) are equipped with lifting lug holes in the flanges.

The meter should only be lifted with straps or with lifting lugs.

#### Never use the index (counter) head or the HF sensors as a handle bar or lifting handle.

The index head contains delicate shafts and gears that may be damaged with inappropriate handling. Improper use may cause inaccurate measurements.

Your meter may be equipped with electronic sensors. The electrical circuits are designed to be intrinsically safe (after EN 60947-5/6 NAMUR). For use with hazardous gas in potentially hazardous area never hook up the meter to non-intrinsically-safe circuits. Refer to hook-up diagrams for all sensor types later in this section.

Use only studs and nuts appropriate for the application and pressure class of the meter. Use new and correct size gaskets only. Ensure that flange faces are free from dirt and sharp metal filings. Gaskets should not protrude into the piping.

#### Do not hydro test the meter.

This was done in the factory. Water or any other liquid media will damage the meter.

Before disassembly of the meter, please observe the following rules:

- For safety reasons NEVER disassemble a gas turbine meter under pressure.
- Do not remove, break, or paint any of the markings and lead seals on a custody transfer meter, because in most coutries the legal status of the meter for custody transfer measurement will become invalid. The meter must be re-calibrated at an approved test facility to regain legal status. The warranty as mentioned in this manual is only applicable if all of the markings and lead seals are undamaged and in place with the original seal stamp.
- If you replace critical internal parts (rotor, bearings, gears or complete internal components) **the meter should be recalibrated at a flow test facility** for the best accuracy. If the meter is to be used in a custody transfer application, the flow laboratory must be approved for custody transfer calibration.

Slowly and carefully fill your gas pipeline and meter-run. **Always fill** the meter pipeline section **from the upstream side** of your meter. Reverse flow and/or over load may damage the meter. Rapid gas expansion causes temperature extremes. Initial flow may cause collected dust and particles to travel and damage your meter.

To empty a gas filled metering section, a vent downstream of the meter should be used, to avoid reverse flow through your IGTM. When provided with a lubrication system: lubricate your IGTM before the first use and at regular intervals during operation.

when provided with a lubrication system: lubricate your igniviberore the first use and at regular intervals during (

#### Please report any problems to the manufacturer.

## vemm tec ENVIRONMENTAL COMMITMENT

*vemm tec* is committed to contribute to environmental protection. We want to reduce the impact of our products on the environment during the whole life cycle. This includes the recycling of the materials and wastes during production and after the useful life.

The final stages of the life time cycle are not directly controlled by us, because you as user control the point of discard and the optional recycling of the product. Nearly all the parts can be recycled after disassembly. The most important parts that should be recycled are the body (iron or steel), internals and index head and other aluminium parts and some stainless steel components. Based on weight we estimate more than 70% of the product is easily recyclable. You can contact **vemm tec** at the end of the use of the product to discuss recyclability or return the meter to us for complete (> 95%) recycling.
